

SafeTransport

One capacity-flow algorithm

$$F_{\epsilon}^* = \arg \min_{F \in \mathcal{F}_S} \langle D, F \rangle - \epsilon H(F)$$

$\mathcal{F}_S$: discounted flow balance, $0 \leq F \leq S$

gray: capacity
teal: flow

Penalty-like
larger ϵ · diffuse flow

vary ϵ within the same solver

Constraint-like
smaller ϵ · concentrated flow

Shared representation across safe-RL regimes; capacities remain enforced.
